

CORNICE BOARDS

General Information

The cornices are padded with polyester fiberfill and constructed of wood.

Non-directional and solid fabrics should be railroaded to eliminate seams. Matching welting is standard on all cornices and is applied to the top and bottom pages. Coordinating colors for welting has a more dramatic effect.

When ordering cornices to fit tight applications (i.e. wall to wall, bay windows), be sure to measure the elevation of this installation. "Exact outside face measurement - wall to wall installation". Allow 1" for clearance.

Measuring:

Measure drapery rod from end bracket to end bracket and add four inches for rod clearance and cornice returns. Six (6") returns are needed when mounted over a single rod and eight (8") returns when mounted over a double rod.
